

PolyStar 3000 Advanced Windshield Protection is a high tech polymer formulation designed specifically to bond to the microscopic porous surface glass of a vehicle's windshield. When properly applied and cured, it coats and levels the surface creating an ultra slick surface which can limit road debris to right angle adhesion only, significantly reducing potential starring and cracking of the windshield.

Repairs any stars, chips or small cracks to the front windshield caused by road hazards that are repairable through an existing Windshield Repair process. Windshield Repair is a permanent process that removes air from the break and fills it with a curable resin. The process bonds the glass together, restores strength to the windshield, improves the break's appearance and prevents the break from spreading. If windshield is unrepairable, it will be replaced at no charge.
